

Mario Mendoza

Senior Software Engineer

Wilmington, Delaware • (918) 399-7904 • mmendoza@mendevo.com •

LinkedIn: www.linkedin.com/in/mariomendoza2/

Portfolio: www.mario.mendozafolio.com

Senior Software Engineer experienced in cloud-native systems and event-driven architectures. Proven track record modernizing legacy platforms, improving reliability through test/resiliency enablement, and accelerating delivery through CI/CD and disciplined engineering practices. Recognized for clear, calm communication. Able to convert complex technical detail into layman-friendly explanations, actionable requirements, and aligned execution across stakeholders. Brings a strong ownership mindset and motivates teams by unblocking work and raising standards.

Technical Skills:

Languages: Java, Python, JavaScript, SQL, Bash

Spring: Spring Boot, Spring MVC, Spring Security, Spring State Machine

Other Frameworks: Django, Flask

ORM: Hibernate/JPA

APIs & Auth: REST APIs, Microservices, Event-driven systems, OAuth2/JWT, SAML/ADFS, OpenAPI/Swagger

Observability: Splunk, Dynatrace, CloudWatch

Cloud/Containers: AWS (EC2, S3, Lambda, ECS/Fargate), Docker, Kubernetes

Databases: Oracle, MySQL, DynamoDB, PostgreSQL

Messaging/Caching: Kafka, Redis

Tools: Git, Maven, Cucumber, JUnit, JFrog Artifactory, ECR

CI/CD: Jenkins, Spinnaker, Pipeline-as-Code

IAC: Terraform (modules/state), EAC (Terraform wrapper)

Additional: Embedded systems, RF transceivers (NRF24L01+), IoT sensor data collection

JPMorgan Chase Co. - SWEIII:

January 2025-Present

-
- Drove the first production code delivery within the new-hire cohort in a regulated environment, establishing early delivery momentum.
 - Implemented the team's standardized component test suite within days of leadership rollout, setting the pattern for required testing adoption.
 - Served as the go-to engineer for test enablement, helping teams implement component, end-to-end, and resiliency testing frameworks when adoption fell behind.
 - Designed and delivered a POC replacing a legacy payment-processing flow with a batch pipeline + Kafka integration, enabling payment detail updates immediately after ACH submission.
 - Consistently unblocked integrations by identifying root causes across complex internal platforms despite sparse or outdated documentation.

Carrier Global - Sr. Software Engineer:

August 2023-January 2025

-
- Owned maintenance, design, and modernization of Java 11 based North American AHU selection platform, spanning customer JavaFX UI through manufacturing data outputs.
 - Enhanced core selection logic implemented in Drools rules engine, including 3D part placement/interference checks, bounding boxes, and parent/child BOM generation.
 - Delivered the platform's first REST API integration to a DXF generation service, implementing OAuth2 and bridging authentication constraints between desktop and service workloads.
 - Led cross-functional team of engineers, providing technical leadership across product development and sustaining projects.
 - Reduced deployment time 50%+ by driving CI/CD adoption and standardizing release processes.

- Established development best practices within the team including code reviews and proper testing environments to improve reliability and maintainability.
- Mentored junior engineers and served as a technical escalation point across the team.

Carrier Global - Full Stack Developer:

August 2022-August 2023

- Replaced brittle Excel/VBA-based production configuration workflow with a low cost, data-driven part number generation system using AWS Lambda + DynamoDB to model option dependencies and encoding rules.
- Refactored legacy VBA logic into a structured, maintainable implementation, reducing configuration/runtime turnaround from days to hours.
- Built SharePoint/Nintex workflow automations including tool calibration scheduling, multi-step approval flows, and dynamic generation of calibration certificates upon approval.
- Pioneered PLM integrations to query part metadata (availability, weights, attributes), enabling curb-weight and sub-BOM calculations leveraging OData feed and Power Query for extraction and transformation workflows.

Vertical Aerospace - Engineer (Automation & IoT):

May 2019 -August 2022

- Designed and deployed internal .NET quality inspection workflow application, reducing inspection cycle time from hours to minutes, improving throughput, and preventing rework caused by missed inspections.
- Built a low-power, radio-enabled, IoT temperature sensor network for monitoring aerospace adhesive out-time compliance.
- Built and deployed Raspberry Pi kiosk dashboards showing inspections KPIs (turnaround time, routing distribution by shop, approval rates vs target and prior month).
